BASICS

Competence

FEINMETALL is your partner for the reliable contacting of electronic components. The wide range of applications for spring contact probes includes board tests with fine centers up to high current test with individual and intelligent solutions.

Broad Competence In-house

The development and manufacturing of spring contact probes, special contact solutions and wafer probe cards in one company are a wide basis for our competence in precision technology and micro-mechanics. This combination is unique at the market and represents "German Technology" at its best.

Innovative Capacity

For many years FEINMETALL represents a high level of innovation. Many patent-registered solutions have been milestones in the world of test engineering.

International Customer Service

We are acting in the international high-tech industry and our processes are aligned accordingly. With seven subsidiaries worldwide and a strong network of well trained partners we are always connected to the markets and to our customers, wherever they are. Local stocks and special customs certificates provide a high delivery performance.

Quality

Quality controls all process steps at FEINMETALL. From product development and construction up to manufacturing and delivery all operation steps are perfectly aligned.

FEINMETALL is certified according to DIN ISO 9001. Additionally a wide range of measures like e.g. risk analysis by FMEA during the whole product development process ensure a maximum of technical as well as delivery reliability.

Environment and Health Protection

FEINMETALL is committed to the goals of the up-to-date legislation regarding environment as well as health protection and to conformance to all necessary measures. The current statements regarding the various European environment and health regulations are available on our homepage.

Traceability of Contact Probes

FEINMETALL contact probes with a sufficient diameter are marked by laser. This enables the traceability of each single contact probe and the correlation to the exact production lot. Additionally the laser marking guarantees the use of "the original".

Customer Focus

Our engineers and technicians work closely together with our customers and have a deep knowledge of the practical applications. Our know-how is your advantage!

TYPICAL TIP STYLES AND APPLICATIONS

**Flat
(16,17)**
Suitable for solder pads
and contact pins.

**Spherical
(11,12)**
For testing clean contact
surfaces, does not leave
marks or scratches.

**Conical
(01,02,03,10,18,32,34,35)**
Universal tip style with
different angles of 10°, 15°,
30°, 60°, 90° or 120° for
contacting solder pads
and vias.

**Triangular
(15,30,62)**
For via holes and solder
pads. The sharp edges
penetrate flux residues
and oxide layers.

**4-point crown
(14,20,21,28,29,37)**
For pad surfaces and
soldered pins. The sharp
edges penetrate flux
residues and oxide layers.

**Square lance
(33,38,43)**
For via holes and solder
pads. The sharp edges
penetrate flux residues
and oxide layers.

**Crown
(09,35,40,41,42,60,63)**
For wire wrap posts,
even if the contacts are
bent or twisted.

**Hexagonal
(07,08)**
For testing plated vias
and pads. The sharp edges
penetrate contamination
and oxide layers.

**Crown with inner pin
(36,68)**
Used for reliable contacting
of plated or filled vias.

**Concave
(05,50,55)**
For a smooth contact of
pins and wire wrap posts.
The risk of contamination
can be minimized by using
a self cleaning version.

**Serrated, W-profile
(06,46,64,66)**
Universal tip style for
contacting wires, pins and
wire wrap posts, even
suitable for bent contacts.

**Insulation cap (IK)
(05,06,17,41)**
For detecting the correct
length and straightness
of pins.

Coaxial design
Tip styles of coaxial probes are
used for contacting standard
connectors or for contacting PCB
test points, SMD mini coax
and switch connectors, see below.

Life Cycle Test of Contact Probes

The life cycle of spring contact probes is depending on the design of the probes as well as on the operating conditions in the field.

High lateral forces, high current load and contamination may lead to a significantly reduced lifetime of the probes. For us as manufacturer of these probes, it is vital to permanently control and review the quality parameters and to analyze the lifetime performance of our products. In our own laboratory we have various test and measurement setups for quality control and for the determination of technical parameters during research and development. One important subject is the life cycle test, conducted with seven

autonomous stress stages. The test conditions provide an internal standard reference that allows competent statements regarding the life cycles of our probes.

Life cycle tests are performed under the following conditions:

- Ambient temperature: +20°C to +30°C
- Relative humidity: 40 to 60%
- Dust free environment

For the life cycle test up to 10 sample probes are mounted in a stress stage and then pressed with a stroke frequency of 5 to 6 strokes per second. In predetermined steps (e.g. after 2000 strokes) the probes are analyzed in a separate test station and the spring force and the contact resistance of each probe are measured as a function of the spring travel (see picture right on the top). Later the test results are combined in a diagram, showing the whole life cycle of the probe (up to more than a million strokes). The diagrams show typical life cycle test results of spring force and resistance.

Pointing Accuracy and Radial Tolerance

The pointing accuracy of a spring contact probe is determined by many factors, for example by manufacturing tolerances, by the length of the plungers and by the type of plunger guiding. Further factors that are independent of the contact probe have to be considered, for example the receptacles and the mounting of the test fixture or module.

To optimize the pointing accuracy especially in applications with small centers additional guiding plates in the fixture can be used. There is always a radial tolerance between plunger and barrel of a spring contact probe.

This leads to a certain deflection of the plunger tip. The guide clearance is necessary and if ideally designed, it guarantees a low abrasion and a reduction of lateral forces. The know-how to produce a good functioning and still long living spring contact probe lies in the definition of the optimum tolerances of plunger and barrel.

The most important factor for the pointing accuracy is the radial deflection of the tip compared to the central axis of the probe at the moment of contacting. The specific pointing accuracy in the technical specifications of the probes is approximately corresponding with the maximum radial deflection. The radial deflection can be shown in a diagram.

Design of Spring Contact Probes

Spring contact probes are typically composed of a plunger, a barrel and a spring.

Plunger

FEINMETALL manufactures plungers with many different tip styles, suitable for a large variety of applications. Plungers are generally made from beryllium copper (BeCu) or steel. Optimized turning and plating processes are resulting in an outstanding straightness and exactness of the plunger surface, the base for a long lifetime. Aggressive tip styles are made by a special grinding process for ultra sharp edges.

Barrel

FEINMETALL barrels are usually made of nickel silver, bronze or brass. Nickel silver barrels are deep-drawn whereas barrels made of bronze are turned or deep-drawn and barrels of brass are turned. All barrels are usually silver or gold plated. A small hole in the bottom permits the barrels to be thoroughly cleaned during manufacturing and ensures continuous wetting in the plating process.

Spring

During the early years FEINMETALL developed long-life springs for the clock industry and subsequently made use of this knowledge in the manufacturing of spring contact probes. Compression springs are normally made of silver plated music wire or stainless steel, for some special applications also of non-magnetic beryllium copper. Springs made of music wire have a working temperature up to a Maximum of 80°C (176°F) while made of stainless steel or BeCu can be operated up to 200°C (392°F).

Spring Force

The selection of the spring force mainly depends on the application. On the one hand the spring force needs to ensure the quality of the electrical contact and the penetration of contaminations or oxide layers. On the other hand it should not lead to any damages on the contacting

surface or on the board. It also needs to be taken into consideration that the penetration of the contacted surface highly depends on the chosen tip style. In test fixtures (especially vacuum fixtures) the sum of all spring forces has to be observed in order to close the fixture and to contact without problems. Due to manufacturing processes and material variances all spring forces have a tolerance of $\pm 20\%$.

Spring Travel

The spring force increases proportional to the spring travel. This linear function is shown in the force-travel-diagram. During the assembly of the probe the spring is already compressed by a certain travel. The resulting spring force is called preload. The preload makes sure that there is a certain force right from the beginning of the contacting process. Also it makes sure that the plunger is completely pushed back after the contacting. The nominal spring force is the spring force at the recommended working travel. The recommended working travel should not be exceeded significantly, because otherwise the life time of the probe could be considerably reduced.

Electrical Specifications

In a contact probe the primary current flow typically leads through the plunger, the barrel and the receptacle.

A secondary current flow leads through the plunger, the spring and the barrel. The transition points cause certain transfer resistances that are influenced by the following factors:

- Conductivity of the base material
- Conductivity of the plating material
- Condition of the surface of the probe
- Size of the contact surface
- Contact forces at the transition points

FEINMETALL is taking measures to guarantee a constant low contact resistance during the whole lifetime of the probes. The maximum continuous currents and the typical resistances of each specific probe are shown in the data sheets.

Important note for all products with electrically insulated functions

like switch probes, switch receptacles, combi receptacles, coaxial probes, insulation caps etc.: **For safety reasons according to DIN VDE 0100, part 410, over electrically insulated parts only low-voltages of maximum 25 V (AC) or 60 V (DC) are allowed.** These values are effective values including voltage pulses due to over-voltages etc.

	Basic Materials	Plating
Barrel	Nickel Silver (deep-drawn) Bronze (turned or deep-drawn) Brass (drilled) Nickel	Silver Gold
Plunger	Beryllium-Copper - BeCu (B) Steel (S) Synthetic Material (K) Palladium Alloy (P) Brass (M)	Chemical Nickel Gold FM-Longtime Gold Rhodium Progressive Coating Multiplex
Spring	Music Wire (max. 80°C) Stainless Steel (max. 200°C) BeCu (non-magnetic, max. 200°C)	Silver Gold
Receptacle	Nickel Silver Bronze Brass	Gold

Materials

The optimum performance of spring contact probes significantly depends on the selection and combination of materials and platings. Developing, testing and qualifying materials for the various applications is an important aspect of our research and development efforts.

Basic Materials

For choosing the optimum basic material for barrel, plunger, spring and receptacle of spring contact probes different aspects need to be considered. Besides the technical applicability also machining and economical factors are relevant for this decision.

Beryllium-Copper

combines outstanding mechanical properties with a high electrical conductivity. It is used for plungers or contact elements in a great variety of products, especially in the field of standard- and high current probes. Also springs can be made of BeCu.

Steel

is significantly harder than BeCu and is used for plungers with aggressive tip styles or the requirement of extremely long durability.

Palladium Alloy

is used as basic material for plungers. Because of the high hardness it is very robust, an additional plating is not necessary.

Nickel Silver

is very resistant to corrosion and is well suitable for machining. Barrels and receptacles made of nickel silver can also be deep drawn economically.

Bronze

is characterized by a combination of good wear resistance, cold formability and high electrical conductivity. It is used for barrels and receptacles.

Brass

is an extremely high quality material with a high electrical conductivity, a good wear resistance and the suitability for different ways of machining. It is used for barrels, receptacles and for special shapes.

Nickel

Barrels in very small diameters can be manufactured by electro-forming. In this case nickel is separated and combined with precious metal. This results in pipes with very thin pipe wall of nickel, that can already be gold plated on the inner surface. These barrels are highly precise, however, the thickness of the pipe wall cannot be varied within one part.

Plating Materials

Typically the surfaces of all elements of contact probes are galvanically plated in order to protect the basic material against corrosion. At the assembled contact probe the plating also reduces friction and thereby leads to low abrasion and low contact resistances.

FEINMETALL plating materials are basically galvanic nickel, chemical nickel, gold, hard gold, longtime gold, rhodium, silver or progressive coating. To achieve the maximum performance the ideal selection and combination of coating materials, coating thicknesses, coating alloys as well as various boundary processes have to be made.

Galvanic Nickel

has a good chemical durability and a hardness of 300 to 500 HV. It has a good ductility and adheres well to the base material. Nickel also prevents the base material from migrating into the precious metal surface and contaminating it and leads to a high temperature stability and life time.

Chemical Nickel

has a very good chemical durability and is not brittle. It has a hardness of 400 to 600 HV. Chemical nickel is most appropriate for aggressive tip styles, because it has a good contouring capability and wear resistance.

Rhodium

is extremely resistant to wear and abrasion. Due to its hardness of 800 to 900 HV it is plated on plungers which are used in very rough applications.

Silver

is used as a bearing surface and as corrosion protection for barrels and springs. The hardness of the silver layer is 80 to 100 HV only, but it adheres very well to the base material even at small diameters. Silver improves the electrical conductivity.

Gold

guarantees the best chemical durability with a hardness of 150 to 200 HV. Gold considerably improves the electrical conductivity. Standard gold is mainly used for plungers made of beryllium-copper or brass.

Hard Gold

is the hardest galvanic gold layer with up to 400 HV. Hard gold differs from the other gold types by its slightly lighter color.

FM Longtime Gold

is a special gold plating layer system for steel plungers developed by FEINMETALL. The combination of steel and FM-Longtime gold results in a high performance and a long lifetime, even at heavy load applications.

Progressive Coating

is a special coating for contacting lead-free soldering pads and other contaminated or oxidized surfaces. This coating is characterized by a high hardness of 550 to 600 HV and a very low contamination of the tips, which leads to a long lifetime of the probes.

Multiplex

is a multi-layer coating system with a very high corrosion resistance. It has been developed for gold plating of steel plungers, that are used in conditions with high humidity.

Different Types of Spring Contact Probes

Spring Contact Probes are available for various applications. Below you find a brief overview of the most important types.

ICT/FCT Probes for Test Fixtures

Test fixtures for in-circuit test (ICT) and functional test (FCT) are mainly equipped with standard probes for the centers 50 mil, 75 mil and 100 mil.

Fine Pitch Probes

Contact probes for centers smaller than 1,27 mm / 50 mil are fine pitch probes. In these centers a direct soldering or the use of receptacles is not possible. Therefore most fine pitch probes are designed as double plunger probes to be mounted into sandwich blocks.

Battery Contacts

Battery contacts are compact probes, often with a limited travel. They are well suitable as charging contact, but they can also be integrated in end user products whenever low-wear electrical contacts are required.

Interface Probes

Interface probes are used for transmitting the signals from the test fixture into the test system. Contact probes for this application are specifically standardized for each test system.

Threaded Probes

Contact probes with thread are mainly used in modules for testing connectors and wire harnesses. The advantage is that even under difficult conditions the probes do not move out of the receptacle and a secure seat is guaranteed.

High Current Probes

For high current applications spring contact probes need to be designed with a very small probe resistance. High current probes are available in different versions and designs.

Switch Probes

Special probes with integrated switch element are mainly used for presence tests. Switch probes close or open an electric circuit after a defined travel of the plunger (switch travel). For non-conductive contacting, switch probes are available with various insulated tips.

Switch Probes with Ball Head

For side contacts with laterally moved test items, FEINMETALL has developed a special switch probe series with a rolling ball as contact element. These probes are less sensitive to lateral forces and have a remarkably higher durability compared to standard probes with only round tip styles.

Pneumatic Switch Probes

For selective contacting of test points or for areas that are difficult to access, it can be helpful to use pneumatic contact probes, operated by compressed air.

Push Back Probes

During push back tests of connectors the tight seat of the connector elements is verified. For this application contact probes with very high spring forces are used.

Kelvin Probes

Very low resistances of components are measured by the 4-wire measurement (Kelvin-method). For this application contacts for the current source and the voltmeter need to be implemented very close to the component. These connections can be realized by special coaxial probes (Kelvin probes), using the outer conductor for the constant current and the inner conductor for measuring the voltage. Therefore measuring errors caused by the connection wires are eliminated.

Radio Frequency Probes

In many applications, like e.g. testing antenna connectors, radio frequency signals need to be transmitted. To carry these signals, special coaxial contact probes are used. RF-probes have an inner conductor for the transmission of the signal and an outer conductor for the electromagnetic shielding.

Receptacles for Spring Contact Probes

For simple replacement spring contact probes are typically mounted into receptacles. The probes are either plugged-in or screwed into receptacles, depending on the type of contact probe. Receptacles are available with different types of electrical connections.

Mounting

Receptacles with collar on top have a fixed projection height and guarantee the tightest seat with very low tolerances. Receptacles with press ring can be used in two ways. Either the press ring is used as dead stop or it is inserted into the mounting plate, which results in a variable projection height. For receptacle insertion into the mounting plate, a special insertion tool is necessary.

Connection of Receptacles

Almost all receptacles are available with solder or crimp connection. Wire wrap connections are frequently used for test fixture manufacturing because they can be wired automatically. Some receptacles (especially those with very small diameters) are available with pre-assembled wires. Additionally, to connect coaxial probes, special connecting elements can be used.

Types of Receptacles

At ICT/FCT test fixtures mainly plug-in probes are used. However, in some applications, particularly at modules for wire harness and connector tests, threaded probes are used, which are

screwed into the receptacles. Threaded probes guarantee a secure seat because they do not move out of the receptacle even under difficult conditions. Knurled receptacles ensure a firm seat of the receptacle in the drill hole. For switch probes and coaxial probes, FEINMETALL has developed special receptacles called "combi-receptacles", which enable a solder free exchange of these probes. Further receptacles with integrated switch function are available, that are frequently used in combination with twist proof probes.

Drilling Recommendations

Mounting the receptacle into the mounting plate demands special precision. Various parameters like rotating speed, feed, helical groove length, material and plate thickness are influencing the drilling results. The drilling recommendations in the technical specifications of the probes are guideline values only as a basis for your own drilling trials.

Therefore it is very important to make drilling tests in order to ensure that receptacles have a proper seat in the mounting plate.

Spacers

For height adjustment and balancing of tolerances.

Spacers H772DS/xx for 100mil Probes

Coaxial Probes for 4-Wire Measurement (Kelvin Method)

Coaxially designed contact probes can be used for the measurement of very low resistances according to the Kelvin-method (4-wire measurement), especially at limited space. In this application the outer conductor is used for the constant current and the inner conductor is used for measuring the voltage.

Overview

Types of Coaxial Probes

For Kelvin measurement

For measuring very low resistances by the Kelvin method (4-wire measurement) coaxially built contact probes can be used by feeding the current by the outer conductor and measuring the voltage by the inner conductor. The figure shows different series of available Kelvin probes.

For RF applications

In many test applications like contacting RF sockets, signals with high frequencies need to be transmitted. For this contact coaxially designed RF probes can be used. In this case the inner conductor carries the signal and the outer conductor is used as shielding (same principle as coaxial cables). This leads to low electromagnetic radiation and interference.

For high current applications

These coaxially designed high current probes have been developed for measuring the inner resistance of applications with very high currents, e.g. for charging and discharging of accumulator cells and batteries.

COAXIAL PROBES

Coaxial Probes

for Kelvin Measurement (4-Wire Measurement)

A Kelvin probe is a coaxial contact probe with two electrically insulated measuring circuits. The typical 4-wire measurement is based on a constant current, flowing through the test resistance and the measurement of the resulting drop in voltage, which is directly proportional to the resistance value. According "I=constant" and because of the very high internal resistance of the voltmeter, the cable and contact resistances are not influencing the measuring result.

This leads to high accuracy of this measuring method. The contacting for current source and voltmeter is realized by two Kelvin probes, ideally located very close to the device under test.

The constant current usually is carried by the outer conductor (force signal), while the voltage drop is detected by the inner conductor (sense signal). The inner and outer conductors of FEINMETALL coaxial probes are independently spring loaded in order to balance mechanical tolerances and heights.

F822 Special Versions

Fakra Connector Contacting

Position- and Straightness Test with Insulation Cap

This probe has a leading insulating cap at the inner contact for testing position and straightness of the connector pin. Bended pins or pins with wrong position do not enter the insulating cap and are not able to contact the inner probe plunger. Inner and outer conductor of the Kelvin probe are spring loaded. Receptacles and probe dimensions please see F822.

Order code: F82205S0007L650IK25

Fakra Connector Contacting

Lamella Socket for Optimal Ground Contacting

This probe is provided with a bezel at the inner and outer contact to center the connector. The connector ground contacting is securely made by a specific lamella socket, which tolerates deviations of position and angle. Inner and outer conductor of the Kelvin probe are spring loaded. Receptacles and probe dimensions please see F822.

Order code: F82241S0008L650S1

Application Note F822

Depending on the shape of the DUT the travel of inner contact and circular contact might be different. As soon as the circular contact is pushed in, the inner contact is carried along. This might lead to other travels and spring forces than the nominal values.

HSD-Female (H819AE1)

The F819 combines several advantages: Conical inlet of the external as well as internal contact for better contacting and compensation of tolerances. In addition, the screwed internal contacts (F17512B0023G150SPS1) prevent the contact from being pulled out of the receptacle. The probe is used for purely electrical contacting of HSD females.

By combining the connection elements H819AE2 and H819AE1 a **defined and reproducible measuring** setup with fix parameters can be realized.

Coaxial Probes for RF-Applications

For transmitting RF signals with coaxial probes the inner conductor carries the signal whereas the outer conductor serves as a shielding.

Typical applications are contacting various standard RF connectors or sockets like e.g. Fakra, HSD, SMA, SMB, SMC connectors or even very small SMD assembled switch connectors or direct test points on a PCB.

RADIO FREQUENCY PROBES

Radio Frequency Probes

Design of RF-Probes

Spring contact probes for RF-applications are coaxial probes. The inner and outer conductors are designed and dimensioned according to the RF specific requirements. That means the signals within a wide frequency band are transmitted with a minimum loss. For evaluation of RF-probes various definitions and parameters are relevant.

Two-Port Network

The common two-port network describes the characteristics of possible transmission paths. These can be wires, radio transmissions or RF-contact probes.

S-Parameters

In radio frequency technology the transmission characteristics of two-port networks are described by S-parameters (scattering parameters). The S-parameters are typically

specified as attenuation given in decibel [dB].

S11: Reflection loss head-sided

S21: Insertion loss

Contact head for terminal element

S12: Insertion loss connection-side

S22: Reflection loss output side

Matching

The matching always refers to the impedance of the DUT and its RF related environment. The more constant the impedance on the transmission path, the better is the reflection and transmission behavior. For RF testing always the complete transmission path of DUT, RF-probe and connecting element has to be considered. A major part of the signal loss is caused by mismatching between RF probe and DUT.

The diagrams given in the specifications partly contain two characteristic curves. These are the performance of the HF860 with and without test specimen in the form of an HF connector and connection element including cable. The type and length of the cable also influence the transmitted signal quality and can reduce the bandwidth. If only

one characteristic curve is specified for the S-parameters, the interfaces to the DUT and connection element are included.

Insertion Loss

The insertion loss describes the transmission behavior of a two-port network and is represented by the value S21. Very often the 3dB cutoff frequency is used as characteristic value. This is the frequency with an attenuation of -3dB. At this frequency the power has reduced by 50% and the voltage by 30%.

Frequency

The values for frequency stored in the catalogue correspond to the maximum operating frequency recommended by FEINMETALL. Depending on the application and the permissible transmission quality, the radio-frequency probes can also be used beyond this. On request, diagrams with the frequency characteristics are available.

New Codes for RF-Probes

Order code:

Is composed of RF-Series and number

DUT (e.g.):

SMA-F (Female)
SMB-M (Male)
GSG (Ground-Signal-Ground)

Mounting options:

F (flange)
P (plug-in)
S (threaded)

Center:

Center specifies only distance ground to signal, otherwise the field is left blank

* the specified value is the recommended maximum operating frequency.

RADIO FREQUENCY PROBES

Coaxial Probes

for Radio Frequency Tests and Transmission of Radio Frequency Signals

FEINMETALL offers sophisticated contact solutions for various industries and applications. Coaxial probes cover a wide range of radio frequency applications like contacting standard RF connectors, switch connectors or RF test points on the PCB.

PCB Test Points

For RF contacts directly on the PCB special RF probes are available. The probe design of these probes (e.g. HF05, HF60) is adapted to the typical requirements of the test points.

SMD mini coax and SMD switch connectors

are used on PCBs as RF interfaces. To contact these FEINMETALL provides different types of RF probes (e.g. HF66).

Connectors

In various telecommunications, consumer electronics and automotive applications different standard connectors like SMA, SMB, SMC, HSD are used. FEINMETALL offers different probe series for contacting these connectors (e.g. HF60, HF19, HF66).

HF60

HF19

RADIO FREQUENCY PROBES

HF77

NEW

Assembly of the RF-probe

The probe variants of the HF77 can be mounted on or through a mounting plate.

Variant: Single plug

Here the probe can simply be screwed to the mounting plate by means of a flange.

Variant: 4-fold plug

Step 1

The module housing [1] is screwed onto the mounting plate using the threaded pins [2].

Step 2

The four HF probes [3] are hooked into the flange provided for this purpose and inserted into the housing [1].

Step 3

With the M2 screws [4] the 4-fold assembly [3] is connected to the assembly-housing [1] screwed tight.

Change of RF-probe

With the release tool FUWZ-001 the pin can be released from the flange. The chamfered tip of the tool is inserted between the flange and the synthetic stop of the spring. Then the spring can be pressed in with the tool and the probe can be pulled out of the groove of the flange. In the same way, the Mini SMP cable connection can be simply pulled off without pulling on the cable.

RADIO FREQUENCY PROBES

Floating bearing of the radio frequency block HF77

Description Structure

functional principle

The collar length of the special screws is slight longer than the collar of the Contact head holder.

Because of the fixed O-ring at the special screw, the Contact head holder is floating and can compensate positional tolerances that may occur.

In addition, each RF-probe is able to float separately inside the Contact head holder.

RADIO FREQUENCY PROBES

CONNECTION CABLES

for Types HF860/HF66

Connection Cables for HF860

Connection element with pre-assembled coaxial cable RG 316.
Impedance: 50 Ohm
Cutoff frequency: recommended up to 3 GHz

H86oAE1  Coax cable 3GHz 700 mm  unassembled
MCX-M straight

H86oAE3  Coax cable 3GHz 700 mm  SMA-M straight
MCX-M straight

H86oAE4  Coax cable 3GHz 700 mm  BNC--M straight
MCX-M straight

Connector with pre-assembled coaxial cable Multiflex 86.
Impedance: 50 Ohm
Cutoff frequency: recommended up to 10 GHz

H86oAE2  Coax cable 10GHz 700 mm  SMA-M straight
MCX-M straight

H86oAE5  Coax cable 10GHz 1500 mm  SMA-M straight
MCX-M straight

H86oAE6  Coax cable 10GHz 800 mm  SMA-M grade
MCX-M angled

Connection Cables for HF66

Connector with pre-assembled highly flexible coaxial cable.
Impedance: 50 Ohm
Cutoff frequency: recommended up to 6 GHz

H66AE1  Coax cable 6GHz 300 mm  mSMP-F straight
SMA-M angled

H66AE2  Coax cable 6GHz 500 mm  mSMP-F straight

RADIO FREQUENCY PROBES

Receptacles

for HF860

The new receptacle H860FL allows a flexible (floating) mounting of the high frequency probe HF60. It permits a wobbling by 360 degrees in case of a small offset to the DUT. Such a possible offset is compensated without damaging the DUT. In released mode the HF probe is returned to its zero point position. The screwable receptacle with knurl (H860RD) is available for the screwable versions of the HF860.

Tools

for HF860

FWZ860HF50

NEW

The FWZ860HF50 is used to screw the probes HF860...M into the screwable receptacle H860RD.

FEWZ-822E0

The FEWZ-822E0 is used to insert the receptacles H860... into the mounting plate.

FDWZ-050

The FDWZ-050 is used to insert the signal pin of the HF860 and HF819 if it is possible to replace the signal pin without damaging it.

FUWZ-001

NEW

With the release tool FUWZ-001 the pin can be released from the flange. The Mini SMP cable connection can also be easily removed without pulling on the cable.

FZWZ-004 / FZWZ-005 / FZWZ-006

With the removal tool, the signal pin of the HF860 or HF819 can be disconnected and replaced.

- FZWZ-004 - Ø0,50 - 0,95mm
- FZWZ-005 - Ø0,95 - 1,55mm
- FZWZ-006 - Ø1,55 - 1,85mm

Mounting of the new RF series

Mounting Options

For the new RF probe series HF66 and HF05 different mounting options are possible.

Some probes can be threaded directly into the mounting plate.

Some versions have a flange that is screwed to the mounting plate, this version allows a simple adjusting and contacting of the DUT. The drill hole for mounting needs to have a sufficient diameter to allow a movement of the probe.

Mounting example 1

Mounting with Flange

For mounting RF probes with flange drill holes for the centering pins, threaded holes for the fixing screws as well as guiding holes for the probe are needed. These need to correspond with the pattern of the flange.

At first, the RF probe is inserted into the guiding hole and brought into the correct position with the alignment pins.

Afterwards the RF probe can be fixed with the screws.

The last step is the connection of the probe with a suitable connection cable. We recommend coaxial cables with low attenuation and low stiffness, because the cables move with the end of the probe when the probe is compressed and they need to allow a certain movement of the probes.

FINE PITCH PROBES

Application Range for Fine Pitch Probes

Fine pitch probes are mainly used for different applications within semiconductor component tests, like e.g. front-end and back-end tests including burn-in test which is an electrical and thermic stress test for semiconductor components.

Different component tests:

- BGA (Ball Grid Array)
- LGA (Land Grid Array)
- QFP (Quad Flat Package)
- QFN (Quad Flat No Leads Package)
- WLCSP (Wafer Level Chip Scale Package)

For testing components, fine pitch probes are commonly used for test heads and test sockets. They serve as interface between DUT and test set-up.

Socket

Chip (WLCSP)

Size comparison between F100 vs. fine pitch probes

F100

Fine Pitch Probes

Fine pitch probes are extremely thin spring contact probes for the use in centers of 0,3 mm to 1 mm. In most cases fine pitch probes are not mounted in separate receptacles, but they are mounted in sandwich design blocks connecting a DUT with a PCB. Typical applications are contacting PCBs with very small structures and building up test sockets.

FINE PITCH PROBES

Mounting of Fine Pitch Probes

Double plunger probes can be used for interfaces without soldering. For this purpose the probes are inserted directly into corresponding bores in the guiding plates. In such a setup the different guiding plates have different drill hole diameters to hold the probe in its position but still allow a movement within the guiding material.

Fine pitch probes are spring contact probes in centers < 1.27 mm / 50 mil.

In these centers direct soldering of probes as well as using receptacles with larger diameters is not possible any more. Therefore most fine pitch probes are used in sandwich design blocks connecting a DUT with a PCB.

Even if only one side is spring loaded the floating movement of the probe within the guiding material allows a travel of the probe tips on both sides.

Application socket

Mounting example FP01

Mounting example FP02

FINE PITCH PROBES

FPXX For the order numbers there is a description for new series in the product range Fine Pitch probes

Depending on the mounting type the probes have either two spring loaded plungers or only one at the DUT side (see picture below).

FP01: Both probe sides are spring-loaded

FP02: Each one side fixed and spring-loaded

FK50

Spring Force Gauge

The Spring Force Gauge allows force measurement at all types of spring contact probes up to 50 N. This instrument allows in a very simple way to verify, if a probe is still intact and to determine the spring force of the probe. The measuring results are displayed at the instrument and the display can be electrically turned by 180° if needed, e.g. for overhead applications. For the measurement just put the measuring sleeve over the probe and push it to the mounting plate. The sleeves depth can be adjusted according to the projection height of the probe. Adjustable measuring sleeves are available with three different diameters.

Technical Specifications

Minimum force: 3g / 0,10oz / 0,03N
 Resolution: 1g / 0,03oz / 0,01N
 Measuring accuracy: +/- 0,5% at 25°C
 Data output: via RS 232 (order code 2111810)
 Power supply: 6 x 1,5V AA (UM-3 batteries)
(Batteries non included in delivery)

Included in Delivery:

- Spring Force Gauge with receptacle for measuring sleeve
- Measuring sleeve \varnothing 5,0mm
- Calibration certificate
- Carrying case

Operating manual available on the homepage.

Dimensions of adjustable measuring sleeves

Measuring sleeve	Inner- \varnothing A [mm]	Outer- \varnothing B [mm]	Height adjustable from/to [mm]
MS30	3,00	4,00	0 - 40,50
MS40	4,00	5,00	0 - 40,50
MS50	5,00	6,00	0 - 40,50

Description

Order code

Tools and Test Connectors

For installation and maintenance of contact probes and receptacles FEINMETALL offers a great variety of tools. For the mounting of standard probes practical insertion- and screw-in tools are useful. For a simple and effective mounting of switch probes tools with integrated functions are ideal, for example to adjust the correct position of the switch point. A spring force gauge additionally enables the measurement of spring forces, for example to identify inserted contact probes in existing modules or fixtures.

CONTACTS FOR COMMON CONNECTOR TYPES

Long-life test connectors for in-circuit, functional and wire harness testing

The need for contacting common USB, RJ or HDMI connector types is not only increasing in the **in-circuit and functional test** of printed circuit boards, but is also becoming more and more important in the **wire harness test**.

Advantages when using FEINMETALL test connectors

- Very high contact cycles; up to 200,000 (depending on test specimen)
- Test connectors do not snap into the DUT compared to normal plugs
- Unnecessary loading or damage to the contact springs in the test piece is avoided
- fixture-side connection of the test connector is very simple and solder-free, using a standard connector (plug and play). In case of maintenance, it is very easy to replace the test connector.

The test connectors can be easily and effectively integrated into test fixtures and test modules. The contacting of the test specimen can be done either by the travel of the fixture or module. Alternatively, it can be integrated into a pneumatically controlled contacting unit (assembly instructions available).

With these new test connectors, FEINMETALL completes its portfolio of contact probes for test engineering and can now offer you even more comprehensive contacting solutions from a single source.

CONTACTS FOR COMMON CONNECTOR TYPES

MOUNTING OF TEST CONNECTORS

Choose the test connector and holding device according to your needs.
In this example: USB

Please note the following guidelines for building up a test fixture

Align the median level of the connector to be tested (DUT) and of the test connector.

Align the lower level of the test connector on the lower internal level of the connector to test (DUT)

CONTACTS FOR COMMON CONNECTOR TYPES

MOUNTING OF TEST CONNECTORS

Place two opposite threaded holes M3 onto the carrier plate. For fixing of the holding device, two screws M3x8 (ISO4768) are required - **not included in delivery!**

Cut a sufficient opening into the carrier plate to have enough space for later insertion of the test connector from the back. Leave at least 1 mm space between opening and test connector.

Loosen the retaining screw of the test connector.
Insert the test connector into the DUT until it comes to rest. Retract the test connector for 0.5 to 1 mm in order to prevent damages of the DUT.

Now the test connector can be fixed by using the threaded pin.

FEWZ

Insertion tools for receptacles

Insertion tool (FEWZ) for receptacles with fixed stop (collar or press ring on top)

Order Code	Insertion height [mm]	Pin- \varnothing [mm]	Receptacle
FEWZ-050E0	0,0	0,8	H050, H787, H051
FEWZ-075E0	0,0	0,9	H075, H175, H176, H310, H701
FEWZ-100E0	0,0	1,3	H100, H320, H502, H708, H731, H805, H863, H865
FEWZ-109E0	0,0	0,5	H109
FEWZ-330E0	0,0		H330
FEWZ-340E0	0,0		H340, H419, H887
FEWZ-348E0	0,0		H348, H349
FEWZ-511E0	0,0	0,6	H111, H511, H730
FEWZ-563E0	0,0	2,0	H563
FEWZ-735E0	0,0	3,5	H735, H725, H775
FEWZ-772E0	0,0	1,6	H772, H727, H732, H752, H875, H876, H877, H878, H879
FEWZ-774E0	0,0	2,6	H774, H566, H713, H723, H733, H735, H737, H773, H810, H866, H867, H880, H881, H884, H885,
FEWZ-822E0	0,0	4,2	H822, H832, H860

All receptacles with dead stop (collar) can be inserted with tool FEWZ-...E0. Press ring at receptacles can be used also as dead stop. The guiding pin of the tool helps to stabilize and properly mount the receptacle.

Insertion tool for receptacles with press ring (inserted)

Order Code	Insertion height X required [mm]	I- \varnothing [mm]	Receptacle
FEWZ-050Exx	xx	1,10	H050, H787
FEWZ-075Exx	xx	1,50	H075
FEWZ-100Exx	xx	1,83	H100

All receptacles with press ring can be inserted with tool FEWZ-...Ex. In this case the x is the fix height level (see picture). This value is required for ordering the correct tool. For often changing projection heights the variable tool below is recommended.

Variable insertion tool for receptacles

Order Code	Insertion height X [mm]	PIN- \varnothing / I- \varnothing [mm]	Receptacle
FEWZ-050EV	0 - 10	0,79 / 1,20	H050, H787
FEWZ-075EV	0 - 12	1,00 / 1,50	H075
FEWZ-100EV	0 - 12	1,38 / 1,90	H100
FEWZ-772EV	0 - 10	1,65 / 2,20	H772

For different height levels of the receptacles with inserted press ring, the tool FEWZ-...EV is recommended. The required height level can be adjusted at the tool..

FDWZ

Insertion tools for plug-in contact probes in receptacles

For inserting the probe into the receptacle tool FDWZ is helpful. After the probe is pushed into the receptacle and stopped by the pressure marks, the probe is driven into the receptacle with the FDWZ tool. The tool is made of a synthetic material to avoid any damaging of the plunger tips. Depending on the design of the contact probe, the tool can also sit on the collar of the probe.

Order Code	Shank- ϕ [mm]	Handle- ϕ [mm]	Length [mm]	e.g. for probe Types
FDWZ-039	A- ϕ =1,00; I- ϕ =0,55	3,00	67,50	F039
FDWZ-050	1,50	6,00	100,0	F050, F051, F086, F588, F768, F787, F788, F111, F112, F605, F665

 H722; H727; H732; H752; H756; H757; H772; H875; H878
 H320; H610; H865
 H100; H502; H708; H731; H751; H805
 H762; H866; H867; H887
 H723; H733; H737; H760; H761; H773; H774; H880; H881; H884; H885

Further variants are updated on the homepage under [PRODUCT FINDER/ACCESSORIES-CP/FZWZ](#).

Below you will find step-by-step instructions for handling the tool.

Step-by-step-Instruction

1. Make sure that the handle is locked!
Screw the tool clockwise into the mounted receptacle until a few turns are cut. This is the case when the screwing in becomes stiffer or the guiding sleeve (03) touches the module.
2. Release the lock: Turn the entire tool back slightly counterclockwise so that the lock can be released more easily. Then hold the flattened surfaces (marked red) and turn the handle counterclockwise.
3. Continue turning the tool clockwise. The receptacle pulls upwards from the mounting plate, into the guiding sleeve and can be removed.
4. Remove the receptacle from the tool with the nipper by screwing it counterclockwise from the tool. The sleeve can be bent by 30°- 90°.
5. For reuse, the thread insert must be screwed all the way down so that the lock can be set.

TOOLS / ACCESSORIES

Hook Wrench

The hook wrench is the standard tool for all probes with square wrench sizes even if the head diameter is larger than the wrench size.

Socket Wrench

The socket wrench can be used for square wrench sizes if the head diameter is smaller than the wrench size. The tool helps to assemble probes within small centers.

Screw driver

Screw drivers can be used if the contact area has any support (e.g. serrated honeycomb or slit) and the head has an integrated locking system.

Tool for Coaxial Probes

For the mounting of large outer conductors FEINMETALL has developed a special tool that enables applications with limited space between the probes.

Tool for Step Probes

For assembly of oversized step probes FEINMETALL has developed a special tool for applications with very limited space between the probes.

Screw-in Tools with Signal Indicator for Switch Probes

Contact Probe	SW	Shank- ØA	FWZ	Batteries	Socket wrench
F880...	2,2	3,7	FWZ880SA	2x AAAA 1,5 V	X
F88890S1101U200S05	5,0	8,0	FWZ888SA	2x AAAA 1,5 V	X
F88890S1102U100S07	5,0	8,0	FWZ888SA1	2x AAAA 1,5 V	X

Batteries not included in delivery

The tool FWZ...SA enables the mounting and correct positioning of switch probes before the final electrical connections are made. The exact switching position can be adjusted by help of the integrated light signal which is illuminated as soon as the switch circuit is closed.

Tool for detection of blocked or tight plungers

With this tool the correct function of contact probes built in at test modules or fixtures can be tested very quickly (max. spring force 600 cN). Thereby a potential damage of connector elements can be avoided.

- Simple tool with integrated switch probe (F885) and light signal
- Test height (nominal travel) adjustable by threaded sleeve
- Spring force adjustment possible by exchange of the integrated switch probe

Order code:

- 32001 (max. Tip-Ø 4,1 mm)
- 32002 (max. Tip-Ø 2,2 mm)
- 32003 Blocking Tester Set composed of:
32001 + adaption for 32002

THE RIGHT CATALOGUE FOR EACH APPLICATION

Application Specific Catalogs

In order to find the right contact probe for your application quickly and at a glance, we have now created four application specific catalogs with appropriate contact probes, including many technical details and application notes.

Our sales offices are perfectly connected to the markets and work in close cooperation with our customers. Most important for us is a high quality - regarding our products as well as regarding our customer support.

Our strengths

- Native-speaking contacts in many countries enable ideal communication
- Application engineers take care of customer projects
- Active key account management provides customer specific know-how
- Teamwork of product managers and local sales engineers facilitate innovative and customized solutions
- Periodic technical trainings make sure that sales teams have a high level of competence
- Technical key customer trainings enhances know-how transfer to end users

These strengths have already resulted in many successful and innovative projects. FEINMETALL is already rated as preferred supplier for many notable companies. Our strong customer support is your advantage.
